

CloudGuard

Application Validation Guide

Steps to access the application and perform a validation flow.

STEP 1 : Login to the Application

1. Open a web browser (Chrome / Edge recommended).
2. Navigate to the application URL :

<http://10.238.46.116>

3. Enter the login credentials and click "Sign In":

Email: admin@krelixir.com

Password: CloudGuard@2026!

4. Upon successful login you will be redirected to the Dashboard.

STEP 2 : Run the AI Pipeline

1. On the Dashboard, locate the Pipeline Control panel on the right side of the screen.
2. Click the "Run Pipeline" button (play icon).
3. A date-picker dialog will appear. Select the Start Date and End Date for the analysis period (the duration of the run).

NOTE

- Dates before 31 March 2026: Logs are fetched from Azure Blob Storage (historical data).
 - Dates after 31 March 2026: Logs are fetched from Azure Log Analytics (real-time data).
4. Click "Start Pipeline" to begin. The pipeline will run through 8 AI agents:
Log Collection -> Preprocessing -> AI Classification -> Root Cause Analysis
-> Priority Assignment -> Context Enrichment -> Resolution -> Email Notification
 5. The pipeline typically completes in 1-3 minutes. Status is shown on the Dashboard.

STEP 3 : Receive Email Notification

After the pipeline run completes, an email will be triggered automatically if any incidents are discovered during the analysis phase.

- P1 (Critical) and P2 (High) incidents trigger email alerts immediately.
- P3 (Medium) incidents are visible only on the Dashboard (no email).
- If no incidents are found, a summary "No Issues Detected" email is sent.

NOTE

There might be a slight delay in logs getting populated in the cloud - this is by design.
Azure diagnostic logs can take a few minutes to appear in Log Analytics or Blob Storage.

CloudGuard - Validation Guide (contd.)

STEP 4 : Validate the Incident Email

In the email received, validate the following details of the reported incident:

Field	What to Check
Incident Title	The short description of the issue detected by the AI.
Priority	P1 (Critical), P2 (High), or P3 (Medium).
Services Affected	Which Azure services are impacted (e.g., Front Door, App Service).
Number of Logs	Total error log count found during the analysis period.
Root Cause	AI-generated explanation of why the error occurred.
Resolution Steps	Recommended actions to fix the issue.
Business Impact	Assessment of how the issue affects end-users.
Owner Team	Which team should own the resolution.

STEP 5 : Review on the Dashboard

1. Return to the Dashboard to see the incident reflected in the Recent Incidents table.
2. Click on any incident row to view full details, Root Cause Analysis, and Resolution.
3. Review the Service Health Topology to see which services are affected (shown in red).
4. Check the Pipeline Runs page (top nav) to confirm the run completed successfully.

Quick Reference

Application URL	: http://10.238.46.116
Data before 31 Mar 2026	: Azure Blob Storage (historical)
Data after 31 Mar 2026	: Azure Log Analytics (real-time)
Email Recipients	: prabhat_singh@ext.icicipruamc.com
Pipeline Duration	: 1 - 3 minutes (varies by date range)
Support Team	: KR Elixir

IMPORTANT

This application is accessible only from the corporate network. Ensure VPN connectivity if accessing from outside the office. The platform supports up to 5-6 concurrent users.
